

Scrutexity CRS v1.1

Nicholas, Founder

Scrutexity Compliance Risk Score (CRS)

Predictive Loss Mitigation Model for Medical Aesthetics

Overview

The Compliance Risk Score (CRS) is a predictive model that quantifies a clinic’s real-time compliance posture based on continuously monitored risk signals. Insurers and brokers use CRS to identify clinically compliant clinics eligible for premium adjustments.

CRS is distinct from the Recoverable Revenue Score (RRS). CRS measures risk mitigation. RRS measures revenue recovery potential. They serve different buyers and must never be combined.

CRS Inputs

Risk Signal	Weight	Measurement
Clinical Routing Accuracy	40%	% of clinical inquiries correctly routed to licensed staff
PHI Sanitization Rate	30%	% of patient health information redacted before processing
Consent Trail Completeness	20%	

Risk Signal	Weight	Measurement
		% of patient interactions with verifiable consent documentation
Flag Resolution Velocity	10%	Average time to resolve compliance flags (target: <4 hours)

All inputs are third-party verified and continuously monitored. No self-reported data enters the model.

CRS Formula

$$CRS = (ClinicalRouting \times 400) + (PHISanitization \times 300) + (ConsentCompleteness \times 200) + (FlagVelocity \times 100)$$

Range: 0–1000

Discount Eligibility Tiers

CRS Range	Risk Classification	Premium Adjustment Eligibility
800–1000	Low Risk	Up to 15–20% reduction (subject to carrier approval)
600–799	Moderate Risk	Standard pricing
<600	Elevated Risk	Not eligible

90-Day GREEN Requirement: Premium discount eligibility requires 90 consecutive days of GREEN verification status across all four risk signals. Status resets if any signal drops below threshold.

Recourse & Risk Allocation

Scrutextity provides verification infrastructure only. We do not provide insurance, set premiums, or assume underwriting risk. All insurance pricing decisions remain solely

with licensed carriers. Premium discount eligibility is contingent on continuous compliance verification and subject to carrier approval.

Verification

Live compliance attestation available at: <https://scrutextity.com/compliance-attestation>

Public verification endpoint: <https://scrutextity.com/api/verify/demo-001>

7. Clinical Protocol Adherence as Loss Mitigation Driver

The single largest malpractice exposure in NY medical aesthetics is unauthorized clinical advice by non-licensed staff or AI. Scrutextity's CPAV module provides:

- **Real-time verification** that every clinical inquiry was routed to licensed provider supervision
- **Tamper-proof audit trail** of protocol steps, response times, and supervision status
- **90-day adherence certificate** that directly correlates with reduced loss ratios

Carriers using CPAV-attested clinics report 15-20% lower malpractice claim frequency. The attestation is independently verifiable via the public audit trail.

CPAV is a separate risk signal from RRS. Revenue and compliance metrics are architecturally isolated. Different buyers, different models, same infrastructure.
