

Scrutexity Predictive Default-Mitigation Model v1.0

Nicholas, Founder

Scrutexity Predictive Default-Mitigation Model (RRS)

Underwriting on Verified Intent, Not Lagging History

Inputs (All Tamper-Proof, Independently Auditable)

Input	Source	Weight
Verified booking value (last 30 days)	Immutable transaction record	Volume score
Inquiry-to-book conversion rate	Data integrity classification	400 pts max
Peer benchmark percentile	Benchmarked peer cohort median	300 pts max
Compliance risk flags (clinical routing)	Clinical compliance verification	-100 pts per flag

Model Formula (Simplified)

$$RRS = (ConversionRate \times 400) + (PeerPercentile \times 300) + (VerifiedVolumeScore \times 200) - (RiskFlags \times 100)$$

Range: 0–1000

Advance Tiers

RRS	Advance Rate	Max Exposure
800+	80%	\$50K → \$250K
600–799	70%	\$35K → \$150K
<600	Ineligible	—

Independent Verification

Every RRS calculation references a publicly verifiable data integrity record: <https://scrutextity.com/api/verify/demo-001>

The scoring inputs are not a black box. They are derived exclusively from tamper-proof data provenance — independently verifiable by any capital partner or credit committee.

Recourse & Risk Allocation

Scrutextity acts solely as data verification infrastructure. We do not extend credit, hold receivables, or assume default risk. Recourse for unconverted consults remains strictly with the originating clinic per the standard factoring agreement.

Scrutextity’s role is limited exclusively to providing real-time, auditable intent signals through our predictive default-mitigation model to reduce information asymmetry for our capital partners.
